Confirm Web API

Introduction

The Confirm Web API is a set of RESTful web APIs, which allows retrieval and modification of data in the Confirm database. The APIs are available automatically with the Confirm web interface.

The APIs can be categorized into two types - Create/Update API and Query API, each of which is described below.

Create/Update API

This API can be used to create new records and to modify existing records.

The following entities and operations are currently available:

Entity	Operations
Features	<p>Create a Feature with Feature Conditions, Feature Attributes, Feature Measurements and Feature Dates.</p> <p>Update a Feature with Feature Conditions, Feature Attributes, Feature Measurements and Feature Dates.</p>
Jobs	<p>Create a Job with Job Items.</p> <p>Update a Job with Job Items.</p> <p>Commit a Job.</p>
Defects	<p>Create a Defect with Defect Attributes.</p> <p>Update a Defect with Defect Attributes.</p>
CentralEnquiries	<p>Add Images and Documents to an Enquiry.</p>
Payments	<p>Create Payment Batch from supplied Jobs. Generates Items automatically, according to Job's current outstanding Items and the supplied Job Value.</p>

For more detailed information on how to use the Confirm Web API, refer to the schema definition:

- ConfirmWebApi.yaml

Query API

This API is designed to allow 3rd party systems to get data from Confirm.

It is developed using GraphQL language, which gives more flexibility and efficiency. It allows users to ask for what they need and nothing more.

The GraphQL query can be generated either via **Confirm Web - Reporting interface** or directly using GraphQL Introspection.

The query can be captured from Confirm Web - Reporting interface using the browser once a report is run, as described here: **Query API - Query Capture** .

One use of the Query API is to allow an external GIS to synchronise data with Confirm, as described here: [Query API - GIS Synchronisation](#) .

Confirm Web - API Authentication

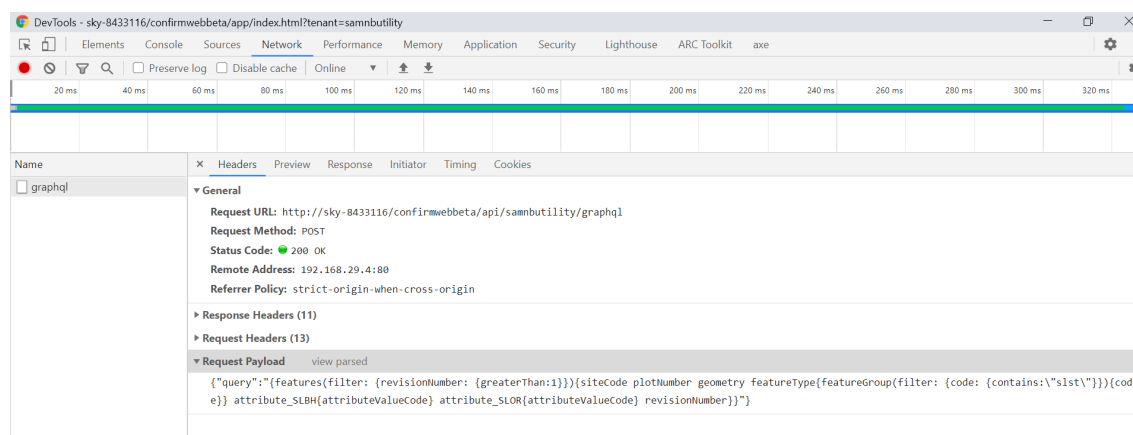

Authentication for the Confirm Web API can be achieved using either OAuth or an API Key linked with a Confirm User. See below for more details of each option:

- **Generating an OAuth token**
- **Authenticating with an API Key**

Query API - Query Capture

The query can be captured from Confirm Web - Reporting interface using the browser once a report is run.

This can be done in multiple ways, developer console in browsers being one of them. Sample screen-shot from chrome browser is as below:

The value of query property (without quotes) within 'Request Payload' is the GraphQL query.

Sample GraphQL query is below:

```
{features(filter: {revisionNumber: {greaterThan:1}}){siteCode plotNumber geometry featureType{featureGroup(filter: {code: {contains:"slst"}}){code}} attribute_SLBH{attributeValueCode} attribute_SLOR{attributeValueCode} revisionNumber}}
```

The results are returned in the JSON format and can be seen in the developer console of the browser as well. Sample screen-shot from chrome browser below:

DevTools - sky-8433116/confirmwebbeta/app/index.html?tenant=samnbutility

▶ 108: {siteCode: "47700239", plotNumber: 100023, geometry: "POINT (-3.753677 51.569478)", ...}

▶ 109: {siteCode: "47700239", plotNumber: 100024, geometry: "POINT (-3.753391 51.569399)", ...}

▶ 110: {siteCode: "47700239", plotNumber: 100025, geometry: "POINT (-3.753197 51.569467)", ...}

▶ 111: {siteCode: "47700239", plotNumber: 100026, geometry: "POINT (-3.752986 51.569457)", ...}

▶ 112: {siteCode: "47700239", plotNumber: 100027, geometry: "POINT (-3.752818 51.569383)", ...}

The captured query can also be run in a REST API client (like Postman), GraphQL query needs to be supplied as a query parameter in the GET request. Sample URL below:

<https://ConfirmWebServer/ConfirmWeb/api/DatabaseName/graphql>

Query API - GIS Synchronisation

One use of the Query API is GIS Synchronisation, where an external GIS can use the Query API to obtain up to date Feature data from Confirm.

GIS synchronization is based on Revision Number field hence it needs be part of API requests. Revision Number is used to keep track of when a feature was last updated so that only Confirm Features that have changed since the last synchronisation are fetched.

The response of this would be JSON list of features with specified columns filtered by the criteria specified in the query. Below is the sample screen-shot of GET API run in the Postman tool:

The screenshot shows a REST client interface with the following details:

- Request:** GET `http://sky-8433116/confirmwebbeta/api/samnbutility/graphql?query={features(filter: {revisionNumber: {greaterT...`
- Response:** 200 OK, 1276 ms, 103.78 KB
- Response Body (JSON):**

```

1  {
2    "data": {
3      "features": [
4        {
5          "siteCode": "2000006",
6          "plotNumber": 1.00,
7          "geometry": "POINT (-74.004004 40.868176)",
8          "featureType": {
9            "featureGroup": {

```

Note: A revision number could include up to 1000 features. Hence it is recommended to have a maximum revision number on GraphQL queries when performing initial synchronization in order to limit the results.

Generating an OAuth token

Follow the steps to generate an OAuth token:

1. Obtain your *API Key (Username)* and *Secret (password)* from Confirm system administrator
2. To generate the OAuth Token, encode your credentials (API Key and Secret) using base64 computation mechanism. To do this, provide API KEY and Secret to the base64 encoder (online encoder can be used), and generate the encoded 'base64value'.
3. The following format should be used while computing the {BASE64VALUE}:

```
{API KEY}:{SECRET}
```

4. Enter the generated 'base64value' in the header of the request and call the token URI as shown in Figure 1 below:

Here, {tenant} is the tenant name and {Confirm web url} is the URL where Confirm web is deployed, like `https://ConfirmWebServer/ConfirmWeb/`.

5. The access token is returned as Figure 2 below

Figure 1:

```
Authorization: Basic {base64Value}
Content-Type: application/x-www-form-urlencoded
POST {Confirm web url}/api/{tenant}/oauth/token
grant_type=client_credentials
```

Figure 2:

```
{
  "access_token": "{your access token as a Base64 encoded value}",
}
```

```
"token_type": "bearer",  
"expires_in": {The expiry time in seconds}  
}
```

Authenticating with an API Key

Follow the steps to generate an API Key for a Confirm User and use in a Confirm Web API:

1. On the User Security screen use the API Key button to generate an API for the User. Make sure you store this key securely, since it will not be accessible directly in Confirm again.
2. The following format should be used while computing the {BASE64VALUE}:
`{username}:{api key}`
3. Enter the generated 'base64value' in the header of the request and call the Confirm Web URI as shown below:

```
Authorization: Basic {base64Value}
```
